PEST CONTROL COMPOSITION INCLUDING NOVEL IMINOPYRIDINE DERIVATIVE

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a pest control composition containing a novel iminopyridine derivative and at least one of other pest control agents.

2. Related Background Art

Although numerous pest control agents have been discovered so far, the development of novel drugs which has high safety is still required in view of the problem of reduction in drug sensitivity, the issue of long-term efficacy, safety to workers or safety in terms of environmental impacts. Further, in agriculture, in order to achieve a reduction in labor for the pest control work, it is general to mix a plurality of components of a chemical for pest control and treat seeds or farm products during the growing seedling period with the chemical, and under these circumstances, it is required to use a long-term residual efficacy type chemical having penetrating and migrating property. In addition, it is also possible to solve problems such as scattering of a chemical to the surrounding environment outside agricultural land or exposure to a person who performs pest control by seed treatment or treatment during the growing seedling period.

European Patent Application Laid-Open No. 432600 (PTL1) discloses a plurality of compounds having the same ring structure as that of a compound represented by Formula (I), but the compounds are used as herbicides and there is no description about pest control.

Japanese Patent Application Laid-Open (JP-A) No. 5-78323 (PTL2) discloses the structural formula of N-[1-((6-chloropyridin-3-yl)methyl)pyridin-2(1H)-ylidene]-2,2,2-trifluoroacetamide (Compound No. 3 in Table 1 of JP-A No. 5-78323), but fails to disclose a preparation method thereof and the compound is not included in a list of the group of compounds that are recognized to have pest control activity (Tables 2 and 3 of JP-A No. 5-78323).

European Patent Application Laid-Open No. 268915 (PTL3) discloses the structural formula of N-[1-((6-chloropyridin-3-yl)methyl)pyridin-2(1H)-ylidene]-2,2,2-trifluoroacetamide (Example No. 12 in Table 7 of European Patent Application Laid-Open No. 268915), but fails to disclose a preparation method thereof and the Example does not include the compound as an example of the compounds having pest control activity.

Chemische Berichte (1955), 88, 1103-8 (NPL1) discloses a plurality of compounds having a ring structure similar to that of a compound represented by Formula (I) to be described below, but the compounds are disclosed only as synthetic intermediates.

European Patent Application Laid-Open No. 259738 (PTL4) discloses a plurality of compounds having a ring structure similar to that of a compound represented by Formula (I), but fails to disclose or suggest a compound having a trifluoroacetic acid imino structure.

Furthermore, these documents do not describe pest control activity when the novel iminopyridine derivative of the present invention is mixed with another pest control agent.

SUMMARY OF THE INVENTION

The present invention is contrived to provide a novel pest control agent to solve problems which chemicals in the related art have, such as reduction in drug sensitivity, long-term efficacy, safety during the use thereof and the like in the field of pest control.

In order to solve the problems, the present inventors have intensively studied, and as a result, have found that a novel iminopyridine derivative represented by Formula (I) has excellent pest control effects against pests and discovered a composition showing excellent pest control effects by containing these novel iminopyridine derivatives and at least one of other pest control agents, compared to when a single agent is used, and a use method thereof. The present invention is based on the finding.

Therefore, an object of the present invention is to provide a pest control composition prepared by containing at least one of a novel iminopyridine derivative represented by the following Formula (I) or acid addition salts thereof and at least one of other pest control agents, which is used in a low dose and shows excellent pest control effects against a wide range of pests.

BRIEF DESCRIPTION OF THE DRAWINGS

A novel iminopyridine derivative represented by Formula (I) may be prepared by the following method.

The reaction may be performed without a solvent or using a solvent which does not affect the reaction, and when a solvent is used, it is possible to use solvents such as, for example, amides such as N,N-dimethylformamide and N,N-dimethylacetamide, nitriles such as acetonitrile, sulfoxides such as dimethyl sulfoxide, ethers such as diethyl ether and tetrahydrofuran, esters such as ethyl acetate and butyl acetate, aromatic hydrocarbons such as benzene, xylene and toluene, alcohols such as methanol, ethanol, propanol and isopropyl alcohol, ketones such as acetone and methyl ethyl ketone, aliphatic hydrocarbons such as hexane, heptane and octane, and halogen hydrocarbons such as dichloromethane, chloroform, chlorobenzene and dichlorobenzene, either alone or in combination of two or more thereof, but N,N-dimethylformamide and the like are preferably used.

<Effects Against Insecticide Resistant Pests>

Reference Test Example 19 Pest Control Test of *Nilaparvata lugens*

A rice seedling in pot culture was subjected to soil drench with a solution of the compound of Formula (I), which had been prepared so as to be a 10% acetone water. Three days after the treatment, ten second instar larvae of *Nilaparvata lugens*, which had been collected outdoors and proliferated indoors, were each released to the rice seedling. Thereafter, the larvae were left to stand in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Six days after the release, the larvae were observed for survival or death, and the mortality of larvae was calculated by the following equation. Test in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

Furthermore, for comparison, the test against a species of *Nilaparvata lugens* which is highly susceptible to imidacloprid was performed by the same method as described above, and the results thereof are shown in Table 45. As described in Table 45, Compound P212 and Compound 1-20 exhibited high insecticidal effects against susceptible species and drug resistant species of *Nilaparvata lugens*, and the death rates of larvae at 0.005 mg/seedling were (susceptible species) 100% and 100%, (resistant population I) 95% and 77% and (resistant population II) 100% and 85%, respectively. Meanwhile, the death rates of imidacloprid at 0.05 mg/seedling were (susceptible species) 100%, (resistant population I) 38% and (resistant population II) 69%, and the insecticidal effect thereof was also low even at a high dose. From the above results, it became obvious that Compound P212 and Compound 1-20 have high insecticidal effects even against *Nilaparvata lugens* resistance against imidacloprid.

Further, for the origin of test pests, bugs collected outdoors from the Kumamoto prefecture (I) in 2007 and from the Fukuoka prefecture (II) in 2005 as resistant population of *Nilaparvata lugens*, and bugs collected from the Kagoshima prefecture and then successively reared indoors for a long time as the imidacloprid susceptible population of *Nilaparvata lugens* were used.

<Mixed Agent Test Example>

Test Example 1 Soil Irrigation Treatment Test of *Laodelphax striatella*

A rice seedling in pot culture was subjected to soil drench treatment with a drug solution of the compound of Formula (I) at a predetermined concentration, or a drug solution of a mixture of a compound of Formula (I) and an insecticide as indicated below at a predetermined concentration, which had been prepared so as to be a 10% acetone water. After the rice seedling was left to stand for 3 days, second instar larvae were released thereto. Thereafter, the larvae were left to stand in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Three days after the release, the larvae were observed for survival or death, and the mortality of larvae was calculated by the following equation. The test was performed in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

In addition, when there was no synergistic effect, a theoretical value was calculated by the Colby's equation shown as follows, and the results are shown in the Table.

theoretical value (%)=100−(*A*×*B*)/100 Colby's equation:

(A: 100−(mortality of larvae or adults when treated only with Compound P212 or Compound 1-20)

B: 100−(mortality of larvae or adults when treated only with each of imidacloprid, fipronil, chlorantraniliprole, spinosad, clothianidin, dinotefuran, sulfoxaflor, pymetrozine, thiamethoxam, flupyradifurone and cycloxaprid))

Method for Judging Synergistic Effects

When the mortality against *Laodelphax striatella* in the case of a mixture with another agent exceeded the theoretical value by the Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that mixed agents of the insecticides of imidacloprid, fipronil, chlorantraniliprole, spinosad, clothianidin, dinotefuran, sulfoxaflor, pymetrozine, thiamethoxam, flupyradifurone and cycoxaprid, which were provided and tested as Compound P212, all show a mortality of larvae or adults, exceed the theoretical value and have synergistic effects.

In addition, it was demonstrated that mixed agents of the insecticides of imidacloprid and fipronil, which were provided and tested as Compound 1-20, all show a mortality of larvae or adults, exceed the theoretical value and have synergistic effects.

Furthermore, it was demonstrated that mixed agents of the fungicides of probenazole, isotianil, tiadinil and orysastrobin, which were provided and tested as Compound P212, all exhibit insecticidal effect equal to or higher than the insecticidal effect when treated with Compound P212 alone and may be mixed and treated with a fungicide. Likewise, it was demonstrated that mixed agents of the fungicide of probenazole, which was provided and tested as Compound 1-20, exhibit insecticidal effect equal to or higher than the insecticidal effect when treated with Compound 1-20 alone and may be mixed and treated with a fungicide.

Test Example 2 Foliar Treatment Test Against *Laodelphax striatella*

A drug solution of the compound of Formula (I) at a predetermined concentration, or a drug solution of a mixture of a compound of Formula (I) and an insecticide as indicated below at a predetermined concentration, which had been prepared so as to be a 50% acetone water (0.05% Tween20 available), was foliar sprayed to a rice seedling in pot culture. After an air drying process, second instar larvae were released thereto. Thereafter, the larvae were left to stand in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Three days after the release, the larvae were observed for survival or death, and the mortality of larvae was calculated by the following equation. The test was performed in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

Further, when there was no synergistic effect, a theoretical value was calculated by the Colby's equation shown as follows, and the results are shown in the Table.

Theoretical value (%)=100−(*A*×*B*)/100 Colby's equation:

(A: 100−(mortality of larvae or adults when treated only with Compound P212 or Compound 1-20)

B: 100−(mortality of larvae or adults when treated only with etofenprox or silafluofen))

Method for Judging Synergistic Effects

When the mortality against *Laodelphax striatella* in the case of a mixture with another agent exceeded the theoretical value by the Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that mixed agents of the insecticides of etofenprox and silafluofen, which were provided and tested as Compound P212 or Compound 1-20, all show a mortality of larvae or adults approximately equal to the theoretical value, and may be mixed with the insecticide even in a foliar treatment-like usage.

Method for Judging Synergistic Effects

When the mortality against *Plutella xylostella* in the case of a mixture with another agent exceeded the theoretical value by the Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that a mixed agent of the insecticide of flometoquin, which was provided and tested, with Compound P212, shows a death rate of larvae or adults, exceeds the theoretical value and has synergistic effects.

$$\text{Mortality of larvae (\%)} = \{\text{number of dead larvae}/(\text{number of survived larvae} + \text{number of dead larvae})\} \times 100$$

Furthermore, a theoretical value for the case of no synergistic effect was calculated using Colby's equation given below, and the results are shown in the tables.

Method for Judging Synergistic Effects

When the insecticidal effect (table) against *Chilo suppressalis* in the case of a mixture with another agent exceeded the theoretical value given by Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that a mixed agent of the insecticide fipronil, cyantraniliprole or spinosad tested with Compound P212 shows a mortality for larvae or adults in excess of the theoretical value in both cases and has synergistic effects.

Test Example 8 Soil Irrigation Treatment Test on *Naranga aenescens*

Rice seedlings in pot culture were subjected to a soil irrigation treatment with a drug solution of the compound of Formula (I) at a predetermined concentration, or a drug solution of a mixture of a compound of Formula (I) and an insecticide as indicated below at a predetermined concentration, which had been prepared so as to be a 10% acetone water. After standing for 3 days, first instar larvae were released thereto. This was followed by standing in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Five days after the release, the larvae were observed for survival or death, and the larvae mortality was calculated by the following equation. The test was performed in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

Furthermore, a theoretical value for the case of no synergistic effect was calculated using Colby's equation given below, and the results are shown in the table.

Theoretical value (%)=100−(*A*×*B*)/100 Colby's equation:

(A: 100−(mortality of larvae or adults when treated only with Compound P212)

B: 100−(mortality of larvae or adults when treated with only the insecticide spinosad or fipronil))

Method for Judging Synergistic Effects

When the mortality against *Naranga aenescens* in the case of a mixture with another agent exceeded the theoretical value given by Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that a mixed agent of the insecticide spinosad or fipronil tested with Compound P212 shows a mortality for larvae or adults in excess of the theoretical value in all cases and has synergistic effects.

Test Example 9 Test on *Callosobruchus chinensis*

A compound of Formula (I) and the insecticide indicated below, prepared in predetermined concentrations using acetone, were separately topically applied to the back of the same adult *Callosobruchus chinensis*. The *Callosobruchus chinensis* was then introduced into a plastic cup and held in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. One day after the release, the insects were observed for survival or death, and the insect mortality was calculated by the following equation. The test was performed in duplicate.

Insect mortality (%)={number of dead insects/(number of survived insects+number of dead insects)}×100

Furthermore, a theoretical value for the case of no synergistic effect was calculated using Colby's equation given below, and the results are shown in the table.

(A: 100−(insect mortality for treatment with only Compound P212)

B: 100−(insect mortality for treatment with only the insecticide fipronil or imidacloprid))

Method for Judging Synergistic Effects

When the mortality against *Callosobruchus chinensis* in the case of a mixture with another agent exceeded the theoretical value given by Colby's equation, a synergistic effect was judged to be present.

It was demonstrated that co-treatment with the insecticide fipronil or imidacloprid tested with Compound P212 shows an insect mortality in excess of the theoretical value in both cases and has synergistic effects.

Test Example 10 Pest Control Test of Rice Blast

A rice seedling in pot culture was subjected to soil irrigation treatment with a drug solution of the compound of Formula (I) at a predetermined concentration, or a drug solution of a mixture of a compound of Formula (I) and an insecticide as indicated below at a predetermined concentration, which had been prepared with a 10% acetone water. Three days after the treatment, a spore suspension (2×10^5 ea/mL, 0.05% Tween available) of rice blast bacteria was sprayed and inoculated thereto, and the rice seedling was placed in a moist chamber for 24 hours to promote infection. Thereafter, the larvae were left to stand in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Seven days after the inoculation, the number of lesions was measured, and the preventive value was calculated by the following equation. The test was performed in triplicate.

Preventive value={(number of lesions in a zone without treatment−number of lesions in a zone with treatment)/(number of lesions without treatment)}×100

As a result, it was demonstrated that in a throughput of probenazole at 0.125 mg/seedling, any one mixed agent of Compound P212 and Compound 1-20 exhibits insecticidal effect equal to the insecticidal effect when treated with probenazole alone and may be mixed and treated with a fungicide.

Test Example 11 Test of Rice Blast Control (Foliar Treatment)

Rice seedlings were treated by foliar application with a drug solution of the compound of Formula (I), or a drug solution of a mixture of a compound of Formula (I) and the fungicide indicated below, prepared in a predetermined concentration with 10% acetone water. After the treatment, a rice blast spore suspension (1.5×10^5 ea/mL, 0.05% Tween available) was sprayed and inoculated thereto followed by holding in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. Fourteen days after the inoculation, the number of lesions was measured, and the preventive value was calculated by the following equation. The test was performed in triplicate.

Preventive value={(number of lesions in a zone without treatment−number of lesions in a zone with treatment)/(number of lesions in a zone without treatment)}×100

As a result, it was demonstrated that at a treatment concentration of 0.5 ppm using tiadinil, isotianil, orysastrobin, tricyclazole, diclocymet, tebufloquin, azoxystrobin or kasugamycin, the mixed agent with Compound P212 also exhibits a fungicidal effect equal to that for treatment with tiadinil, isotianil, orysastrobin, tricyclazole, diclocymet, tebufloquin, azoxystrobin or kasugamycin alone and a mixed treatment with a fungicide is therefore possible.

Test Example 12 Test of Control of Rice Sheath Blight (*Rhizoctonia solani*)

Six weeks after planting, rice seedlings were subjected to foliar spray treatment with a drug solution of the compound of Formula (I), or a drug solution of a mixture of a compound of Formula (I) and a fungicide as indicated below, prepared in a predetermined concentration with 10% acetone water. After an air drying process, a plug of growing *Rhizoctonia solani* (1.0 cm^2 agar square each) was allowed to stand at the base of the rice. This was followed by holding in a thermostatic chamber (30° C. 15 day-25° C. night, 16 hours of light period-8 hours of dark period). Six days after the inoculation, the lesion height was measured, and the preventive value was calculated by the following equation. The test was performed in duplicate.

Preventive value={(lesion height in a zone without treatment−lesion height in a zone with treatment)/(lesion height in a zone without treatment)}×100

As a result, it was demonstrated that, at a treatment concentration of 5 ppm using thifluzamide, furametpyr, pencycuron, azoxystrobin, simeconazole, validamycin, or orysastrobin, the mixed agent with 50 ppm Compound P212 presented the same fungicidal effect as for treatment with thifluzamide, furametpyr, pencycuron, azoxystrobin, simeconazole, validamycin, or orysastrobin alone, and mixed treatment with a fungicide is therefore possible.

Test Example 13 Test with *Laodelphax striatellus* by Treatment During the Vegetative Phase

Rice was planted in nursery boxes and emergence was carried out for three days a 30° C. followed by transfer of the nursery boxes to a glass greenhouse at 25° C. During the vegetative phase five days after planting, the nursery boxes were treated with a prescribed amount of a mixed granule of 0.24 mg/mg probenazole (24%) and 0.02 mg/mg Compound P212 (2%). The rice seedlings were transplanted to 1/5000a Wagner pots 22 days after planting and were grown in a greenhouse at 25° C. Second instar larvae of 15 *Laodelphax striatellus* were released at 13, 26, and 38 days post-transplantation to the Wagner pots; this was followed by holding in a glass greenhouse at 25° C. Five days after the release, the larvae were observed for survival or death, and the larvae mortality was calculated by the following equation. The test was performed in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

According to the results, it was shown that the mixed granule of probenazole and Compound P212 presented a high insecticidal effect of 100% mortality and exhibited control at a practical level.

Test Example 14 Test with *Laodelphax striatellus* by Soil Irrigation Treatment

Rice seedlings in pot cultivation were subjected to a soil irrigation treatment with a drug solution of a compound of Formula (I) or a drug solution of a mixture of a compound of Formula (I) and a paddy herbicide as indicated below, prepared in predetermined concentrations so as to be a 10% acetone water. After standing for three 20 days, second instar larvae were released thereto. Thereafter, the larvae were left to stand in a thermostatic chamber (16 hours of light period-8 hours of dark period) at 25° C. five days after the release, the larvae were observed for survival or death, and the larvae mortality was calculated by the following equation. The test was performed in duplicate.

Mortality of larvae (%)={number of dead larvae/(number of survived larvae+number of dead larvae)}×100

The mixed agent of Imazosulfuron, cafenstrole, cyhalofop-butyl, daimuron and pyrazolate tested with the Compound P212 was shown in all instances to exhibit an insecticidal effect at least equal to that for treatment with Compound P212 by itself, and a mixed treatment with a herbicide is thus possible.

Test Example 15 Test of the Control of *Haemaphysalis longicornis*

A capsule with a diameter of 2 cm and a height of 2 cm was attached to the dorsal surface of a mouse. A compound of Formula (I), ivermectin, moxidectin, permethrin, amitraz, fipronil, spinetram and the mixture of the compound of Formula (I) and each insecticide were dissolved in ethanol at the concentrations given in Table O, and each of these was dripped onto the surface of a mouse body within a capsule. After thorough drying, eight *Haemaphysalis longicornis* nymphs were released and the top of the capsule was sealed with a lid. The mouse was kept in a cage at 25° C. using a 12-hour light period and a 12-hour dark period. Five days after the release, the capsule was removed and the number of surviving and dead nymphs and the number of engorged individuals were counted and the insect mortality and agonal rate was calculated by the following equation.

Insect mortality and agonal rate (%)={number of dead and agonal insects/(number of survived insects+number of dead and agonal insects)}×100

The results showed that, at a rate of 0.009 μg of ivermectin or moxidectin, the mixed agent of either with Compound P212 also gave a tick control effect that was the same as treatment with ivermectin, moxidectin, permethrin, amitraz, fipronil and spinetram alone and mixed treatment with ivermectin, moxidectin, permethrin, amitraz, fipronil and spinetram is thus possible.
